# Script 4b: Weather Com - all users - current conditions

Uses the normal weather.com page. It provides a forecast for current conditions and 3 more time periods.

Go to

http://www.weather.com/

and search for your place's forecast. If found, go to the today forecast and copy the address.

Put the script folder in your home folder: ~/4_Conky_WeatherCom/4b

Navigate inside the folder and make the script executable:
Either by right clicking it or by

```
chmod +x ~/4_Conky_WeatherCom/4b/4b_WeatherCom
```

Open the script with your favourite text editor and replace my location's address at the address variable with yours.

Open also the save_page.js file in the script folder and put:

celsButton - if you want metric output
fahrButton - if you want imperial output

Dependencies of the script:

phantomjs
imagemagick

The first time the script is run, it's gonna take its time to populate conky, don't worry about it: phantomjs is slow.
